Treatment of Female Stress Urinary Incontinence

The use of Macroplastique in the treatment of SUI is a simple procedure that avoids the degree of complications and the post-procedure convalescence associated with alternative treatments. In correctly diagnosed and selected patients, this procedure provides a simple outpatient day case solution in both primary and secondary indications.

Superior Performance at 1 Year

In a randomised, controlled multi-centre trial (RCT), the Macroplastique group (n=122) outperformed the collagen control group (n=125)

- 80% of patients were dry or markedly improved based on physician evaluation
- 62% of patients improved by at least 1 Stamey Grade; statistically superior results compared to 48% of collagen group (p < 0.05)

Improved Outcomes at 2 Years

In the RCT, Macroplastique patients followed to 2 years (n= 84) maintained excellent outcomes

- 75% of patients had an improvement of at least 1 Stamey Grade

Sustained Results at 5 Years

- 83.3% success for Type I
- 80% success for Type III

“Urethral injection therapy has been shown to provide statistically significant and clinically meaningful improvements in QoL. Indeed, the QoL improvement is similar to that with surgery.”

“Macroplastique has been shown to be a safe and effective treatment for female stress urinary incontinence, with sustained results through two years.”
